

Dear Hiring Manager,

I am applying for the Android Engineer position at Glovo, with a strong interest in contributing to the Central Order Tracking SDK team.

I have professional experience developing Android applications using Kotlin and Jetpack Compose, including building data-driven UIs and integrating backend services via REST APIs. In my previous roles, I worked closely with backend systems to deliver real-time data visualization and improve system observability.

More recently, I have been developing Android applications independently, focusing on modular architecture, reusable UI components, and scalable design. I have hands-on experience with multi-module Gradle setups, Coroutines and Flow for asynchronous programming, and API integration using Retrofit and OkHttp. I am particularly interested in building SDK-like solutions and designing flexible UI components that can adapt across different use cases and brands.

What excites me most about this role is the opportunity to work on a shared UI SDK that impacts multiple products globally. I enjoy working on problems related to reusability, performance, and consistency, and I am motivated to contribute in a collaborative environment where engineering decisions have large-scale impact.

Thank you for your time and consideration. I would welcome the opportunity to discuss how I can contribute to your team.

Kind regards,
Ferhat Sanli
